Hi pikaspurs, The .gz file extension refers to the compressed version of the update. This is not the original update file. In fact, the compressed update files usually contain additional information that enables the game to not only skip downloading the additional content but also to load it into memory as it is being loaded. This was the reason why we began using the compressed updates back in the day. Since you already have a copy of the updated file, what you need to do is get the updated game file with .tga extension into the directory where the game is installed. This is because after you unpack the updated file, it will open the game data directory which is where the .tga is stored. The game data directory is usually located at: C:\Program Files\Steam\steamapps\common\Orcs Must Die 2 As of right now, the update for the latest version of the game is already available. So, when you open the update file, it will skip all the stuff and begin downloading the updated file. So, if you want to use the .tga, you just need to copy the updated.tga file into the game data directory. Make sure you are copying the file into the game data directory of the latest version of the game. The other option is to get a backup of the files that are in the game data directory. You could either download the backup file to your computer or save it on a memory card that you can access at anytime. Just make sure you can get to the game data directory again. I believe this update only contains the Steam version of the game and is missing the original version. Therefore, you may want to save the game on a hard drive or use any other backup option. If you do so, I suggest that you save the backup file into the game data directory that you are copying from. It will 82157476af
